

UpStart combines nitrogen with potassium, calcium, and magnesium. UpStart can be made with N and any of the other nutrients in combination or alone. Formulated with ammonium N, the most easily used form of N for plants and highly available (soluble) K, Ca, and Mg. Used as a starter, a hiller product in potato production or through irrigation systems as fertigation.

UpStart contains unique chemistry to affect plant development

- Critical micronutrients for early plant growth
- Amine chemistry to improve early root growth
- Factors to maintain hormonal balance in young plants
- Specific amino acids and enzymes that ramp up plant metabolism, resulting in controlled root development and increased seedling vigor—setting the stage for higher yield potential
